b) Altitude

- Higher altitudes tend to have cooler temperatures. The lapse rate explains the decrease in temperature with increasing elevation.
- Questions may involve interpreting temperature variations in mountainous regions versus plains.

c) Distance from the Sea (Continentality)

- Coastal areas experience milder temperatures due to the moderating influence of oceans, whereas inland areas have extreme temperature variations.
- MCQs may test students' understanding of maritime vs. continental climates.

d) Ocean Currents

- Warm currents raise temperatures of coastal regions; cold currents lower them.
- For example, the Gulf Stream warms northwestern Europe, while the California Current cools the west coast of North America.
- Questions may involve identifying the impact of specific currents on regional climates.

e) Winds and Air Masses

- Winds transfer heat and moisture, affecting climate and weather patterns.
- The monsoon winds in India are a classic example, influencing seasonal rainfall patterns.

- Classification of Climates

The chapter discusses various climate classification systems, notably the Köppen Climate Classification, which divides the world into five main climate types:

- Tropical Climate (e.g., Equatorial regions)
- Dry Climate (desert and semi-arid zones)
- Temperate Climate (mild and moderate)
- Cold Climate (continental and polar zones)
- Highland Climate (mountainous areas)

MCQs often ask students to identify regions belonging to specific climate types based on climatic data or descriptions.
