Step-by-Step Guide to WSN Simulation Using MATLAB

Step 1: Define Network Parameters

Start by specifying:

- Number of nodes
- Area dimensions (e.g., 100m x 100m)
- Sensor sensing range
- Communication range
- Initial energy per node

```matlab

numNodes = 50;

areaSize = [100, 100]; % in meters

sensingRange = 15; % meters

communicationRange = 20; % meters

initialEnergy = 2; % Joules

```

Step 2: Generate Node Positions

Position nodes randomly or in a structured manner within the deployment area.

```matlab

positions = [rand(numNodes,1)areaSize(1), rand(numNodes,1)areaSize(2)];

```

Step 3: Create Network Topology

Determine which nodes are within communication range of each other, forming an adjacency matrix.

```matlab

adjacencyMatrix = zeros(numNodes);

for i = 1:numNodes

for j = i+1:numNodes

distance = norm(positions(i,:) - positions(j,:));

if distance
adjacencyMatrix(i,j) = 1;

adjacencyMatrix(j,i) = 1;

end

end

end

```

Step 4: Implement Routing Protocols

Choose or develop routing algorithms suitable for your simulation, such as LEACH, PEGASIS, or a simple shortest path.

Step 5: Model Energy Consumption

Define functions to simulate energy used during transmission, reception, sensing, and data

processing.

```matlab
function energyConsumed = transmitEnergy(distance, packetSize)
% Free-space model: E = Eelec + Eamp d^2
Eelec = 50e-9; % J/bit
Eamp = 100e-12; % J/bit/m^2
energyConsumed = (Eelec + Eamp distance^2) packetSize;
end
```

Step 6: Run Data Transmission Simulation

Simulate sensor nodes sensing environment, transmitting data, and updating energy levels with each cycle.

```matlab
for cycle = 1:maxCycles
for node = 1:numNodes
if energy(node) > 0
% Sense data
dataSize = 5000; % bits
energy(node) = energy(node) - sensingEnergy;
% Transmit data to the sink or next hop
nextNode = selectNextHop(node, adjacencyMatrix);
```

```
distance = norm(positions(node,:) - positions(nextNode,:));

energy(node) = energy(node) - transmitEnergy(distance, dataSize);

end

end

% Record network metrics

end
```

Visualization and Analysis of WSN in MATLAB

Visualization is vital for understanding network behavior. MATLAB?s plotting functions can be used to display node locations, communication links, and energy levels.

```matlab
figure;

plot(positions(:,1), positions(:,2), 'bo');

hold on;

for i = 1:numNodes

for j = i+1:numNodes

if adjacencyMatrix(i,j)

plot([positions(i,1), positions(j,1)], [positions(i,2), positions(j,2)], 'k-');

end

end

end
```

```
xlabel('X Position (m)');

ylabel('Y Position (m)');

title('Wireless Sensor Network Topology');

grid on;

hold off;

Fundamental Steps in WSN Simulation Using MATLAB

Simulating a WSN involves several interconnected steps:

- Defining Network Topology
- Node Deployment
- Implementing Energy Models
- Designing Communication Protocols
- Simulating Data Collection and Transmission
- Analyzing Performance Metrics
- Visualization and Interpretation

Let?s explore each step in detail.

1. Defining Network Topology

The network topology determines how nodes are spatially distributed and interconnected:

- Types of Topologies:
- Grid: Nodes arranged in a regular grid pattern.
- Random: Nodes deployed randomly within a region.
- Clustered: Nodes grouped into clusters with designated cluster heads.
- Hybrid: Combines multiple patterns.

- Implementation in MATLAB:
- Use `rand()` or `randn()` functions to generate random node positions.
- Define a coordinate system (e.g., 2D plane) for node placement.

Example:

```matlab
```

```
numNodes = 100;

areaSize = 100; % 100x100 units

nodePositions = areaSize rand(numNodes, 2);
```

2. Node Deployment

Deploying nodes involves initializing their positions, attributes, and states:

- Attributes to Initialize:
- Coordinates `(x, y)`
- Energy level
- Node ID
- Role (e.g., sensor, sink, relay)

- Energy Model Initialization:
- Assign initial energy based on application needs.

Example:

```matlab
initialEnergy = 2; % Joules

nodes = struct();

for i = 1:numNodes

nodes(i).id = i;

nodes(i).position = nodePositions(i,:);

nodes(i).energy = initialEnergy;

nodes(i).status = 'active'; % or 'dead'
```

end

```

## 3. Implementing Energy Models

Energy consumption is critical in WSN simulations:

- Transmission Energy:
- Depends on distance, data size, and radio model.
- Reception Energy:
- Usually less than transmission energy.
- Sensing Energy:
- Consumed during data acquisition.

Basic Energy Model:

```matlab

% Free space model

E_tx = 50e-9; % J/bit

E_rx = 50e-9; % J/bit

E_amp = 100e-12; % J/bit/m^2

% Energy for transmitting d bits over distance d

function energy = transmitEnergy(d, dataSize)

energy = dataSize (E_tx + E_amp d^2);

end

% Energy for receiving data

function energy = receiveEnergy(dataSize)

energy = dataSize E_rx;

end

```

4. Designing Communication Protocols

Protocols govern how nodes communicate, conserve energy, and organize data flow:

- Data Gathering Protocols:
- Direct Communication: Nodes send data directly to sink.
- Multi-hop Routing: Data hops through intermediate nodes.
- Clustering: Nodes form clusters with a cluster head aggregating data.

- Energy-Efficient Routing:
- Use algorithms like LEACH, PEGASIS, or custom protocols.

Example:

```matlab

% Simple multi-hop routing: nodes forward data towards sink

sinkNode = [areaSize/2, areaSize/2];

for i = 1:numNodes

node = nodes(i);

d = norm(node.position - sinkNode);

energyConsumed = transmitEnergy(d, dataSize);

nodes(i).energy = nodes(i).energy - energyConsumed;

if nodes(i).energy
nodes(i).status = 'dead';

end

end

```

5. Simulating Data Collection and Transmission

This step models how data is sensed, transmitted, and received over time:

- Time Steps:
- Define discrete time intervals for simulation.
- Data Generation:
- Each node generates data periodically.
- Data Transmission:
- Nodes transmit data based on protocol rules.
- Energy Updates:
- Deduct energy based on transmission/reception.

Sample Simulation Loop:

```matlab

numRounds = 100;

for t = 1:numRounds

for i = 1:numNodes

if strcmp(nodes(i).status, 'active')

% Generate data

dataSize = 4000; % bits

% Transmit data to sink or next hop

d = norm(nodes(i).position - sinkNode);

energyUse = transmitEnergy(d, dataSize);

nodes(i).energy = nodes(i).energy - energyUse;

```
if nodes(i).energy
nodes(i).status = 'dead';

end

end

end

% Additional logic for routing, clustering, etc.

end
```

6. Analyzing Performance Metrics

Key metrics to evaluate WSN performance include:

- Network Lifetime: Time until a certain percentage of nodes die.
- Packet Delivery Ratio: Successful data packets received at sink.
- Energy Consumption: Total energy used over time.
- Latency: Time taken for data to reach sink.
- Coverage: Area monitored effectively over time.

Visualization Example:

```matlab
aliveNodes = sum(arrayfun(@(n) strcmp(n.status, 'active'), nodes));

deadNodes = numNodes - aliveNodes;

bar([aliveNodes, deadNodes]);

xlabel('Node Status');

ylabel('Number of Nodes');

set(gca, 'XTickLabel', {'Active', 'Dead'});
```

title('Network Node Status after Simulation');

```

## 7. Visualization and Interpretation

Visual tools are vital for understanding network behavior:

- Node Deployment Map:
- Plot node positions with different colors for active/dead nodes.
- Energy Levels:
- Use color gradients to represent residual energy.
- Topology Changes:
- Show routing paths or cluster formations.
- Temporal Dynamics:
